Application for GCP Data Engineer position at JAKALA

To the attention of the recruiting team at JAKALA,

I am applying as a *GCP Data Engineer* because I believe it would be a game-changing experience, enhancing my personal and professional growth. I think your mindset built around innovation, curiosity and precision would guide me in the development of my dream career. My academic path made me develop a problem-solving and result-oriented attitude that I would like to bring into play, contributing to JAKALA's mission.

I am very passionate about everything that involves software: it has always fascinated me. When I was 4 years young, I got my first personal computer. I was so enchanted that I learnt to read and write on my own thanks to it. Growing up, I decided to fully embrace this passion by becoming a software engineer.

Today, I am a student at the university of Bologna, currently working on my master's degree final thesis in collaboration with Prometeia. I joined the latter company as a software engineer intern, and I am working on a data integration project, learning about the Spark technology. Alongside my academic career, I have always worked even within environments unrelated to technology, driven by search for independence. As branch leader inside supermarkets, I improved my communication skills and ability to work in a team, showing my dedication, perseverance and commitment. As a waiter, I learnt to maintain a positive and optimistic attitude even under pressure, working for customer's satisfaction.

JAKALA is the company that seeks to overcome impossible challenges, and I want to take part in this process. Within your reality, I would be able to fulfill my curiosity and interest in discovering new amazing technologies. Your approach towards problem-solving from an engineering standpoint, analyzing problems and designing the best solution in a structured way impressed me. My interests revolve around writing secure and reusable software, paying particular attention to task automation. Also, I am intrigued by pair programming, the DevOps philosophy and domain-driven design. I am looking forward to explore such values in an environment that encourages open debate and diversity. In fact, I really appreciate the attention you pay to Spooners, their personal development and working-life balance. For all these reasons, I really want to join your culture and create a win-win relationship.

I would be glad for an opportunity to introduce myself to you in an interview.

Thank you for your time and consideration,

Sincerely,

Simone Romagnoli
